I've been using the XmGraph widget that's been floating around and I noticed the performance is significantly better using Gadgets, perhaps even 100% faster. I had heard in an old programming course that gadgets were no longer any benefit to performance, and that it's just as well to use widgets everywhere. So why would ~50 pushbutton gadgets be a lot quicker than 50 pushbuttons in the graph? Should I start putting gadgets back into my long pulldown menus?

XmGraph manages children connected by XmArc widgets in a directed network type graph with automatic layout capability.
